

Power Filters

Aqueon™ Power Filters were designed with the fish and the aquarist in mind. Our patented design includes unique features to enhance water quality and clarity, increase oxygen levels and lessen noise.

More Stages and Filtering Capacity

Aqueon Power Filters feature four stages of filtration—mechanical, chemical, biological and wet/dry—for the clearest, cleanest oxygen-enriched water. Patented Aqueon dual-sided replaceable dense-floss cartridges contain over 25% more activated carbon than the leading brands and have been designed to ensure even distribution of carbon throughout.

Higher Flow Rates

Aqueon filters have higher flow rates than the competition to ensure proper turnover for cleaner water and higher dissolved oxygen content, making fish healthier and more active.

Superior Biological Filtration

The patented biological grid has a large surface area to support more of the beneficial bacteria that eliminates ammonia and nitrates. A second wet/dry grid provides further biological filtration and oxygenation as the water returns to the aquarium.

New Internal Pump Design

Since the filter pump is submersed in the aquarium, there is no need for priming at setup or when restarting the filter after cleaning or power interruptions. An internal pump also allows for virtually silent operation, continuous flow rates, less chance for leaks and physically, a much thinner profile.

Color-coded retail packaging helps consumers match correct size filter to aquarium.
